Rubber Buffers / Cellular Buffers Program 0170 / 0180

General Information

Stop buffers are essentially damping units that absorb energy, for example at the end of a crane runway, to prevent damage and allow for smaller structural dimensions. In general, "energy before geometry" applies to buffers because load diagrams, precisely defined characteristic curves, physical dimensions, and mathematical formulae are used when dimensioning the buffers. Geometrical dimensions are of secondary importance here. Stop bumpers are not to be used as vibration dampers or supports.

Safety, quality, and know-how are our main focus!

Modern production methods, constantly increasing working speeds, and increasing demands for ergonomic working environment, make greater demands on existing buffer systems. Due to the wide variety of available buffer designs, we can offer a solution for every application. We have a large standard range of rubber buffers and cellular buffers to provide for individual solutions. Special designs are always possible by request.

Applications:

- Travel limitation
- Energy absorption
- End stops
- End position dampening

Rubber Buffers: Program 0170

Since rubber buffers are made from cost-effective, basic materials, our program offers an economic solution for most technical requirements. The energy absorption of a rubber buffer is limited due to the compression limits of the material.

Rubber-Metal Elements: Program 0170

Rubber-metal elements are used to support dynamic loads and isolate them from vibration. As a rule, the rubber-metal elements in this catalog are calculated based on construction attributes, as opposed to energy absorption or vibrational characteristics, given their usual application as a support member and isolation element.

Cellular Buffers: Program 0180

Due to their excellent energy absorption properties the cellular buffer program is a suitable complement to the rubber buffer program. Their volume compressibility allows long compression lengths and very good deceleration values.

Rubber Buffers and Cellular Buffers at a glance

- Highest dynamic and mechanical capacity
- Versatile resilience against demanding environmental conditions
- Compression travel up to 50% buffer height

- High energy absorption abilities make cellular buffers a maintenance-free and inexpensive alternative to complex buffer systems.
- Low delay values and very good damping qualities
- Lightweight design
- Compression travel up to 80% buffer height

Rubber Buffers / Cellular Buffers

Program 0170 / 0180

Fall Protection

Accidental falling of the stop bumpers is prevented by safeguard measures – so-called “fall protection” – which provides comprehensive safety for man and machine. Cellular bumpers with integrated safety rope and form-fitting, foam-covered cap are used for installation heights > 3 m. Fall protection is a standard feature for all cellular bumpers. The reliable vulcanization process, permanently joining the fastening element to the rubber bumper body, adds to the overall safety of the bumpers. We take special care when choosing the raw material for our bumpers, using only the best quality materials. This results in homogenous base compounds, very high durability, and consistently excellent energy absorption of the bumpers. Years of experience and continued development by the inventor of stop bumpers, Manfred Wamplier, still form the knowledge base of bumper manufacturing to this day.

Integrated safety rope
(250 mm buffer diameter or higher)

Placement

Mounting surfaces and counter-pressure surfaces must be level and parallel with the bumper. This avoids lateral forces and ensures a concentric, linear application of force and an impact over the whole reception area of the bumpers.

Vertical eccentricity of oppositely mounted buffers must not be higher than 10% of the buffer's diameter:

Rubber Buffers / Cellular Buffers

Program 0170 / 0180

Project Planning

- Determine the effective mass and impact velocity
- Calculate the basic energy formula: $W = \frac{1}{2} m \times v^2$
- Determine the energy distribution for each single buffer
- Select the needed buffer (cellular or rubber material), depending on general requirements
- Select the buffer geometry according to max. buffer energy W_{max} from the tables on pages 11, 26, and 27 depending on the bumper type.
- Calculate the expected compression length
(from diagram – see catalogs "Load Diagrams - Rubber Bumpers" and "Load Diagrams - Cellular Bumpers" on www.conductix.com)
- Calculate the resulting reacting force
- Check the resulting deceleration

Possible Buffer Arrangements

Buffer Loads

The load on the bumpers has to be centered and perpendicular to the bumper base plate. Do not weld the bumper base plate to the host surface. Use mounting screws according to DIN 6912 or DIN 7984.

Diameter expansion with maximum load:

- Rubber buffer:
 $s = 0.5 h \hat{=} D = 1.4 d$
- Cellular buffer:
 $s = 0.5 h \hat{=} D = 1.25 d$
 $s = 0.8 h \hat{=} D = 1.4 d$

Bumper against bumper arrangement (cellular bumpers):

- Permissible:
 $h_1 + h_2 \leq 2 d$
- Not permissible:
 $h_1 + h_2 > 2 d$

Because of variations in guiding and impact accuracy, the impact surface must be at least 25% greater than the bumper diameter: $D > 1.25 d$
 $D = \text{impact surface}$
 $d = \text{bumper diameter}$

Impact direction:
 $\alpha_{max} = \pm 4^\circ$

Bumper characteristics are shown by the load-length curves. With rubber bumpers the shape of the curves mainly depends on the shape and the shore hardness.

With cellular bumpers, volumetric density is the decisive factor for their physical behavior. Due to the spring characteristic curve of rubber and cellular bumpers (load F depending on the compression length s) the bumper final pressures, which are required for the specification of the neighboring components, can only be determined with static tests.

- A_1 = energy loss (hysteresis)
- A_2 = restoring energy
- $A_1 + A_2$ = energy absorbed by the bumper

Rubber Buffers / Cellular Buffers

Program 0170 / 0180

Basic Calculation Formulas

- Mass against limit stop

$$W = \frac{1}{2}mv^2$$

- Mass against mass

$$W = \frac{m_1 \cdot m_2 (v_1 + v_2)^2}{2(m_1 + m_2)}$$

$$m_1 = m_2 \text{ und } v_1 = v_2$$

$$W = m \cdot v^2$$

- Driven mass against limit stop

$$W = \frac{1}{2}mv^2$$

$$W_2 = F_0 \cdot f$$

Buffer force-travel diagram

- Free fall (this formula does not apply for elevators)

$$W = m \cdot g \cdot h$$

- Calculation of buffers for cranes

$$W_b = \frac{1}{2}m_b v^2$$

$$m_b = \frac{m_{tr}}{2} + \frac{m_{ra}(L-l)}{L}$$

- Oscillating masses not taken into account
- Centrifugal moment of rotating parts must be taken into account
- Velocity must be reduced according to DIN 15018:
 - v = 100% rated velocity on trolleys
 - v = 85% rated velocity on cranes
 - v = 70% rated velocity on cranes with brakes

- Formulas for calculating the deceleration

$$a_{red} = \frac{v^2}{2f}$$

$$a_{max} = \frac{F}{m}$$

a_{red} : Median deceleration (m/s ²)	h: Drop height (m)	m_b : Mass on rail B (kg)
a_{max} : Maximum deceleration (m/s ²)	L: Rail spacing (m)	v: Velocity (m/s)
F_0 : Driving force (kN)	l: Distance m_{tr} to B (m)	v_{b1} : Velocity body 1 / body 2 (m/s)
F: Maximum buffer force (kN)	m: Mass (kg)	w: Kinetic energy (kJm)
f: Compression length (mm)	m_{tr} : Mass crane without trolley (kg)	w_1 : Kinetic energy (kJm)
f': Acting compression (mm)	m_{tr} : Mass of trolley (kg)	w_2 : Work acting through F_0 (kJm)
g: Gravity acceleration (9.81 m/s ²)	m_1/m_2 : Mass body 1 / body 2 (kg)	w_{2c} : Max. energy absorption (kJm)

Rubber Buffers Program 0170

General Information

Natural caoutchouc rubbers are characterized by their very high elasticity, notch impact resistance, and good abrasion resistance. Among all elastomers, these have the highest mechanical and dynamic load capacities. Natural caoutchouc is not resistant to electrolytic liquids, aliphatic, aromatic hydrocarbons, or chlorinated hydrocarbons.

Oil and natural gas are the basic materials for synthetic caoutchouc. For many years, this has been a substitute material for natural caoutchouc, but today synthetic caoutchouc is increasingly used as first choice for many applications. Today there are a wide range of synthetic caoutchoucs, whose properties allow a variety of applications thereby establishing the use of rubber technology within modern methods. Rubber is not merely a chemical substance, but a compound of many different materials.

The varied mechanical and anti-corrosive properties can only be achieved by a recipe of several hundred substances. Caoutchouc, as a macro-molecular material, provides the elastic components of the rubber. The mechanical properties, such as breaking elongation, resilience elasticity, strength, and continuous breaking strength are dependent on it. The addition of chemicals and other additives and the subsequent vulcanization process make the material useful.

The multitude of additive combinations as well as the many physical forms means that for most problems there is a solution.

Rubber buffers are molded to the metal base plates. In rubber buffers with threaded bolts, the bolts are inserted twist-proof. Visible areas are primed or galvanized, respectively.

Example Part Number

Application Examples

- Crane systems
- Transfer cars
- Smelter and rolling mill machines
- Handling technology
- Plant construction and engineering
- Conveyor, transport, and gate systems, etc.

Rubber Buffers Program 0170

Conductix-Wampfler Standard Rubber Quality

N-Quality

- Resilient and tear-resistant
- Aging resistant
- Material incompressible
- Operating temperature: -30 to +70°C*
- Hardness: 70 Shore A +/-5

S-Quality (by request only)

- Seawater and ozone-resistant, weather-proof, oil and to a large extent acid and aging resistant
- Operating temperature: -30 to +80°C
- Hardness: 70 Shore A +/-5

Special qualities and special constructions by request!

* Characteristics may change depending on ambient temperature

Rubber-Metal Elements Program 0170

General Information

Rubber-metal elements are used as flexible mechanical fasteners for vibration-free mounting of light to middle-weight machinery. These elements are usually defined geometrically and by hardness and have no determined energy absorption.

The following vibrations are insulated, or dampened respectively:

1. Mechanical vibrations caused by components of the system (e.g. electric motor) and abrupt impacts.
2. Impact sound (sound waves that spread over the system parts).

Application Examples

- Machine frames in material handling
- Frames with drive and control units in general engineering
- Conveyor systems
- Machine tools

Example Part Number

Part No.: **017221-050x040/615**

Selection Chart: Materials

Ref. No.	Material
1	NR Natural caoutchouc
2	CR Chloroprene caoutchouc
3	NBR Nitrile-Butadiene caoutchouc

Selection Chart: Shore Hardness

Ref. No.	Shore A
4	40
5	55
6	60
7	70
8	80

Types and Quality Characteristics

Vulcanization guarantees the highest cohesiveness between rubber and steel.

Rubber-Metal Elements:

- Metal parts vulcanized to one or two sides
- Metal parts galvanized

Rubber-Metal Elements Program 0170

Conductix-Wampfler Standard Rubber Quality

- Natural caoutchouc, hardness 55 Shore A +/-5
- Highly elastic and tear-resistant
- Material incompressible
- Aging resistant
- Operating temperature: -30 to +70°C
- Not suitable for permanent contact with gasoline, greases, oils, and ozone

Special qualities and special constructions by request!

Quality Degrees of the Most Common Materials

Conductix-Wampfler Qualities	N	S	Special Qualities ¹⁾			
International abbreviated designation	NR Natural caoutchouc	CR Chloroprene caoutchouc	SBR Styrene-Butadiene caoutchouc	EPDM Ethylene-Propylene Terpolymere	NBR Nitrile-Butadien caoutchouc	VMQ Silicone caoutchouc
Abrasion resistance	++	++	++	+	++	--
Breaking elongation	+++	++	++	+	++	○
Tear resistance	++	++	+	+	+	---
Rebound resistance	++	+	+	+	+	+
Tensile strength not reinforced	+++	+	--	--	--	---
Tensile strength reinforced	+++	++	++	+	++	○
Temperature resistance, hot air	+90 °C	+120 °C	+100 °C	+150 °C	+130 °C	+200 °C
Temperature resistance, coldness	-50 °C	-30 °C	-40 °C	-40 °C	-40 °C	-80 °C
Alkali resistance	+	++	+	++	+	--
Aging resistance	+	++	+	+++	+	+++
Gasoline resistance	---	++	○	--	+++	--
Electrical insulation resistance	+++	+	++	++	4	+++
Oil and grease resistance	---	++	--	○	+++	+++
Ozone resistance	○	++	○	+++	+	+++
Acid resistance	+	++	+	+++	○	--
Hot water	+	+	++	++	+	--

Quality degrees of the individual material properties (depending on interactions and exposure time):
+++ = very good; ++ = good; + = satisfactory; ○ = sufficient; -- = deficient; --- = insufficient

Tolerances of the rubber parts according to ISO 3302-1M

Cellular Buffers Program 0180

General Information

Cellular buffers have high absorption capacity with long compression lengths. This results in small end loads and favorable deceleration values. Cellular buffers have a compression body made of cellular polyurethane elastomer with high structural stability. Their outstanding characteristic is their volume compressibility, which produces a short transverse elongation under pressure. Cellular buffers are resistant to aliphatic hydrocarbons, such as oils and greases, as well as ozone, UV-radiation, and aging. Technically, you can expect generally high durability. When exposed to hydraulic oil, hot water, or water vapor over longer periods, the cellular body has limited durability. Cellular buffers are not resistant to strong acids and leaches. The operating temperature is between -20°C and +80°C. Temporary temperature peaks of +100°C are practicable and do not harm the buffer. When exposed to -20°C the material becomes harder, but this does not affect the consistency of the material. The mounting structure must be flat and rigid. A mounting area of at least 1.5 x the diameter of the cellular buffer is required to accommodate the diameter increase of the buffer during compression.

Example Part Number

Application Examples

- Cranes
- Transfer cars
- Smelter and rolling mill machines
- Handling technology
- Plant construction and engineering
- Conveyor, transport and gate systems that are equipped with form-locking drives (e.g. chain or toothed rack).

Conductix-Wampfler Standard Cellular Buffer Quality

Cellular polyurethane elastomer with a volumetric weight of 0.53 g/cm³

- Highly elastic and tear-resistant
- Aging resistant
- Material is volume compressible
- Operating temperature: -20°C to +80°C (characteristics may change depending on ambient temperature)

Fall Protection

We recommend using 018112 series buffers for installation heights of 3 m or higher. All series 018112 buffers have an integrated fall arresting device. Buffers with diameters up to 200 mm have base plates made of glass fiber reinforced plastic and an integrated fall arresting device. Buffers with diameters of 250 mm or higher (optionally from 200 mm) have primed steel base plates. These buffers are glued to the base plate and have a fall arresting device in case of failure of the bond seam due to environmental conditions.

For use as a safety component, please consider the applicable regulations for the final product and the recommendations from the risk analysis for this case. Buffers should be replaced every five years for safety-relevant applications.

Quality Degrees

Abrasion resistance	++
Breaking elongation	++
Tear resistance	++
Rebound resistance	++
Tensile strength	++
Temperature resistance hot air	+80 °C
Temperature resistance coldness	-20 °C
Alkali resistance	○
Aging resistance	++

Gasoline resistance	○
Electrical insulation resistance	+
Oil and grease resistance	++
Ozone resistance	+++
Acid resistance	---
Hot water	+

Quality degrees of the individual material properties (depending on interactions and exposure time): +++ = very good; ++ = good; + = satisfactory; ○ = sufficient; -- = deficient; --- = insufficient
International abbreviation: PUR (cellular polyurethane elastomer)

Tolerances of cellular buffers according to ISO 3302-1M3 ISO 3302-1M4

** Lower speeds reduce the maximum energy absorption. See Load Diagrams Catalogue on www.conductix.com

Rubber Buffers / Cellular Buffers

FAQs

How is a buffer's hardness specified?

The hardness of a rubber buffer is measured in Shore A. The lower the hardness index number, e.g. 50 Shore A, the softer the buffer.

Example reference values for shore hardness would be: 40 Shore A (soft – gummy bear), 60-70 Shore A (middle – car tire), 90 Shore A (hard – softwood).

Rough hardness classification of buffers:

40-50 Shore A = medium soft buffer

70 Shore A = normal hardness

80-90 Shore A = hard rubber parts

Shore hardness is specified with very high tolerances of at least ± 5 Shore A, corresponding to deviations occurring during production. Lower tolerances are only possible to a limited extent, making stricter specifications of buffers uneconomical.

Contrary to rubber buffers, cellular buffers do not receive a hardness grading. Due to their cell structure a measurement of hardness is not possible. To determine the characteristics, volume weight is used. High cell number/low density = low volume weight. Low cell number/high density = high volume weight.

How does energy absorption correlate to ambient temperature and buffer intervals?

The stated value for maximum energy absorption refers to a standardized room temperature of $+20\text{ }^{\circ}\text{C}$. This value decreases with rising temperatures. For a single thrust, e.g. 1 x per hour, this only needs to be taken into account when higher temperatures ($> 50\text{ }^{\circ}\text{C}$ ambient temperature) occur.

However, if the buffer is impacted repeatedly in shorter intervals, this has to be taken into account, as well as the fact that the buffer might not have enough time to disperse the thermal energy. Also, the buffer will settle and will not take his original shape in time. This lowers the possible energy absorption value for the next thrust. If energy input and energy disposal are not balanced, the buffer will be destroyed. The resulting heat in conjunction with the pressure forces make the buffer lose its characteristics and it will eventually crystallize.

What are the consequences if a buffer is overdimensioned?

To ensure sufficient safety, buffers are often ordered larger than necessary, however, when compressed, a buffer will build up a counter-force directly proportional to the buffer size. The larger the buffer, the higher the reset force and the corresponding deceleration.

Therefore, buffers should not be dimensioned too large, "just to be on the safe side". Maximum permissible deceleration and end forces on the structure must be observed.

What makes rubber buffers unsuitable?

Standard quality rubber buffers are not suitable for low temperature applications or for exposure to mineral oils or gasoline. When exposed to mineral oils, buffers made from NBR, CR or our S-quality buffers must be used.

Which specifications are necessary for buffer planning?

The minimum details required are: effective mass, velocity, maximum permissible deceleration, and information about framework conditions/particular application.

How should buffers be arranged when installed next to each other?

For this kind of arrangement, the distance between the outer planes of the buffers must be at least 40% of the buffers' diameter (e.g. if the buffer diameter is 100 mm, the distance between buffers must be 40 mm). Furthermore, buffers arranged next to each other must strike simultaneously.

What are the requirements for the counter-pressure surface of the end stop buffer?

The size of the counter-pressure surface must be defined by the equipment manufacturer. The size of the surface area depends on buffer diameter and guide clearances. The buffers must strike over the whole counter-pressure surface area.

Important aspects during operation

No permanent loads must be applied to the buffers, and therefore they must not be used as bearing points (in compressed state) for repair or maintenance work. Only perpendicular (to the base plate) application of force is permissible. Furthermore, buffers must not be climbed on or be exposed to other extreme lateral forces.

Rubber Buffers / Cellular Buffers FAQs

Are there specific maintenance and cleaning instructions for the buffers?

During standard operational and environmental conditions, rubber and cellular buffers are maintenance-free, with a long life cycle. We recommend regular visual checks concerning cracks, embrittlement, or other damages. If such damages are detected, the buffers must be replaced. Buffers should be replaced at least every 5 years when used as a safety component. Buffers showing damage or traces of weathering must be replaced immediately, if necessary, measures to avert possible hazards must be taken – please consult maintenance instruction WV0180-0170-E (PDF on www.conductix.de/en).

How are smaller buffers/rubber-metal elements designed?

End stop buffers with diameters up to 50 mm are called rubber-metal elements, these are chiefly regarded as mounting parts. Only limited data about their compression length and energy absorption can be found on the market. A calculated construction in the traditional sense of the word does not occur, since expenses and energy values would be disproportionate to the tolerances in calculation and materials. In practice, mounting dimensions and practical trials are used to lay out the rubber-metal elements.

What does under-delivery and overdelivery of made-to-order rubber buffers mean?

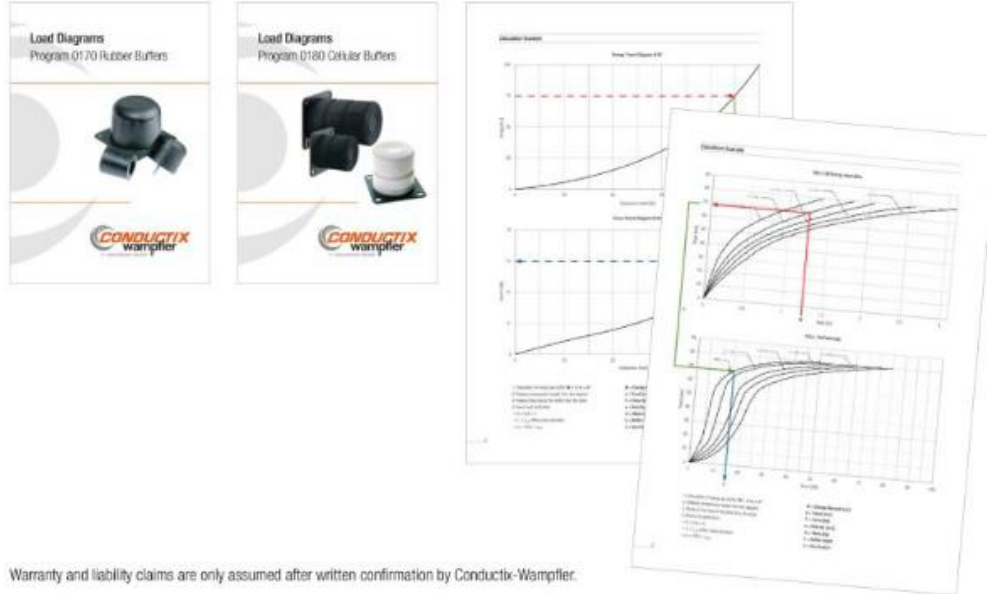

The vulcanization process produces a significant amount of discard, thus fluctuations in quantities occur during production. Remanufacturing often proves to be more expensive than the original batch ordered, hence conditional under or overdeliveries of up to 10% are acceptable sales standard in the rubber industry.

Discoloring of cellular buffers

New cellular buffers are ivory or cream colored. Under the influence of light, buffers can change color to a dark brown tint. This process is material-inherent and has no effect on operational or characteristic values of the buffer.

Load diagrams of our buffers are available on: www.conductix.de/en

For exact calculations of required buffer sizes, please consult our load diagram catalogs, available as PDF (KAT0170 and KAT0180 Load Diagrams) on www.conductix.de/en.

Custom services!

Conductix-Wampfler is a customer-focused, market-driven company. Our customers can rely on us to provide service for their specific needs and requirements.

With Conductix-Wampfler anything is possible, from the initial design and development to long-term service contracts. Whatever your needs are, we can deliver!

For complicated systems, high expectations for extended service life, and absolute need for operational reliability, it makes sense to take advantage of our after-sales service. When it comes to service, you can count on Conductix-Wampfler to perform.

Project Planning

- Inclusion of application parameters in coordination with the customer
- Selection of the suitable buffer system
- Layout creation according to customer's needs
- Software-aided process simulation

Mounting / Installation

- Complete system mounting
- Complete installation
- Adjustment of controls

Initial operation

- Initial commissioning by trained personnel
- Test operation and accident simulation
- Scrutineering with the customer
- Training and briefing on-site

Maintenance & Service

- Regular maintenance and inspections increase the life cycle of the system and thus ensure prolonged availability
- Conductix-Wampfler service contracts: the "worry-free package!"

Ordering standard products and basic systems online – fast and easy

Webshop for B2B customers

More than 900 standard products in the catalog and 20,000 available by direct ordering. You can conveniently order your products online from Conductix-Wampfler right now.

With customer-specific prices, quickly and easily – anytime.

User-friendly, with integrated upload feature or by navigating through clear image menus – the ordering process is easy and takes no time at all.

Keep track of all transactions on your account using the comprehensive administration function.

And best of all: when you order online there is **no surcharge for small quantities!**
www.conductix-shop.eu

Your Applications – our Solutions!

Buffers from Conductix-Wampfler represent only one of the many solutions made possible by the broad spectrum of Conductix-Wampfler components for the transport of energy, data and fluid media. The solutions we deliver for your applications are based on your specific requirements. In many cases, a combination of several different Conductix-Wampfler systems can prove advantageous. You can count on all of Conductix-Wampfler's Business Units for hands-on engineering support – coupled with the perfect solution to meet your energy management and control needs.

Cable reels

Motorized reels and spring reels by Conductix-Wampfler hold their own wherever energy, data and media have to cover the most diverse distances within a short amount of time - in all directions, fast and safe.

Festoon systems

It's hard to imagine Conductix-Wampfler cable trolleys not being used in virtually every industrial application. They're reliable and robust and available in an enormous variety of dimensions and designs.

Conductor rails

Whether they're enclosed conductor rails or expandable single-pole systems, the proven conductor rails by Conductix-Wampfler reliably move people and material.

Non-insulated conductor rails

Extremely robust, non-insulated conductor rails with copper heads or stainless steel surfaces provide the ideal basis for rough applications, for example in steel mills or shipyards.

Energy guiding chains

The "Jack of all trades" when it comes to transferring energy, data, air and fluid hoses. With their wide range, these energy guiding chains are the ideal solution for many industrial applications.

Slip ring assemblies

Whenever things are really "moving in circles", the proven slip ring assemblies by Conductix-Wampfler ensure the flawless transfer of energy and data. Here, everything revolves around flexibility and reliability!

Inductive Power Transfer IPT®

The no-contact system for transferring energy and data. For all tasks that depend on high speeds and absolute resistance to wear.

Reels, retractors and balancers

Whether for hoses or cables, as classical reels or high-precision positioning aids for tools, our range of reels and spring balancers take the load off your shoulders.

Jib booms

Complete with tool transporters, reels, or an entire media supply system – here, safety and flexibility are key to the completion of difficult tasks.

Conveyor systems

Whether manual, semiautomatic or with Power & Free – flexibility is achieved with full customization concerning layout and location.

www.vaznehcrane.com

Conductix-Wampfler

has just one critical mission:
To provide you with energy and
data transmission systems that
will keep your operations up
and running 24/7/365.
